

Swedish Program

Energy and Environmental Economics

Fall 2020

Syllabus

(preliminary version, to be updated during the course)

This course provides a general overview of important aspects of provision, management, and economic and political importance of energy resources and their environmental implications.

More specifically, the course will start by addressing market interactions, pricing and regulation in oil and gas markets. In this discussion, we will also cover most recent developments in the energy field, such as fracking revolution in oil and gas, as well as touch upon the issues of energy security. We will proceed to address the environmental aspects of energy production and consumption, talk of renewable energy, emissions and emission trading, and discuss the prospects of green energy transition. To add a broader economic perspective, we will also look into the impact of energy resources, and natural resources in general, on economic and institutional development.

This course is typically given credit by Economics departments.

Intended learning outcomes: By completing this course a successful student will be able to

- Describe and analyze the key issues in functioning of oil and gas markets, and their influence on the market outcomes for consumers and producers;
- Describe and analyze the environmental aspects of energy;
- Assess advantages and disadvantages of currently used and proposed energy- and environment-related policies and regulations;
- Analyze and explain the interrelation between resources, institutional and economic development;
- Discuss and conceptualize topical issues within the field of energy and environmental economics with a group of peers.
- Use instruments such as tables, graphs, basic game-theoretical models and analytical tools to analyze the issues of energy and environmental economics.

The approaches learned in the course would also enable the student to examine economic problems in other related fields such as international trade, theory of industrial organization or political economy.

Pre-requisites: Two courses in macroeconomics, two courses in microeconomics, and one course in calculus.

Teachers:

Elena Paltseva, Assistant Professor of Economics at Stockholm Institute of Transition Economics (SITE) at the Stockholm School of Economics.

- E-mail: elena.paltseva@swedishprogram.org, Phone: +46 8 736 9688

Guest lecturer: Pamela Campa, Assistant Professor of Economics at Stockholm Institute of Transition Economics (SITE) at the Stockholm School of Economics.

- E-mail: pamela.campa@hhs.se

Webpage: Readings, lecture notes, and other information about the course will be uploaded on the course webpage. It is thus very important that you visit it often.

Lectures: There will be 12 three-hour classes. They include classic lecturing, discussions, presentations of individual work, article discussions, a study visit and speed dating on energy issues. The lectures are held at the Stockholm School of Economics.

Readings: The course reading will mostly consist of articles and reports (see below for a preliminary list, subject to revision). There will be no single required textbook. However, occasional chapters from Subhes C. Bhattacharyya, 2011. "Energy Economics. Concepts, Issues, Markets and Governance", Springer will be used during the course.

Attendance and participation: Regular attendance is mandatory. An unexcused absence may negatively affect your final grade. Your grade will not be affected if you miss a class due to illness or in the case of a (documented) emergency situation. If you have a personal or family event that conflicts with a class, and cannot be re-scheduled, you may ask your instructor for an excused absence. Such a request should be made at least one week prior to the class in question. In case of excused absence you will be asked to do an assignment on the topics you missed.

Active participation in class discussions is expected. If there are any readings that you are expected to complete before the class, please come to class prepared to engage fully with the materials.

Case discussion/presentation will be based on the same case study for the entire class. Students will form groups, and each group will present a specific aspect of this case, followed by general discussion. For example, a case can address global oil and gas industry, with questions to groups including (i) a comparison of the profitability of the oil value chain segments, and reasons for variation in profitability, (ii) advantages of relying on natural gas vs. oil in historical perspective, etc.

Group project/presentation: Same groups as for the case discussion are also expected to work on a group project and present your findings in class. The subject of the project is to be within the energy economics or environmental economics, and can be either chosen from a list of potential topics offered by the teacher, or proposed by the group itself. The project should be based on a scientific approach, including a well-posed question, clear methodology and criticism of your sources. You will receive more instructions during the course.

These hand-ins are then followed by in-class presentation of your project. After each presentation we have a short class discussion. Again, more information and guidance will be provided in the beginning of the course.

Written final exam: A 2-hour exam will be held in during the exam week, and will cover all the material of the course. It will include both analytical and essay-type questions. An example of exam questions will be provided early in the course.

Grading: Your final grade will be calculated according to the following breakdown:

- Participation, including "speed dating" on energy markets: 15 %
- Case discussion/presentation: 25%
- In-class presentation of the project: 30 %
- Final exam: 30 %

Course topics and reading list: (please note that the reading list is preliminary and will be updated as the course proceeds. Compulsory reading is marked by *.)

Energy and environmental economics: introduction.

Preliminary lecture plan

Lecture #	Topic
1	Energy and environmental economics: introduction.
2	Basics of game theory. Oil market-1
3	Oil market -2
4	Gas market
5	Shale revolution. Case discussion
6	Resources and development
7	Resources and development/Study visit
8	Environmental economics (guest lecture by Pamela Campa)
9	Environmental economics (guest lecture by Pamela Campa)
10	Environmental economics (guest lecture by Pamela Campa)
11	Energy Security. Speed Dating.
12	Presentations. Q&A session for the exam (if time permits). Final exam
