Environmental Economics Syllabus

Fall 2022

This course studies the multiple links between the economy and the environment, and analyzes theoretically and empirically the set of policy instruments normally used to address modern environmental problems. It also consider environmental policy through political economy lenses, namely it analyzes political and societal factors that affect what policy instruments governments tend to choose. Typical questions that will be answered are: What are the most pressing environmental problems? How and why does economic activity create these problems? What are the policy instruments that governments and other relevant decision makers can use to protect the environment? What are the economics costs of environmental regulation and is there a case for a "double dividend" from environmental policy? How do we determine the optimal level of environmental protection at societal level? What are the economic effects of climate change and why does it prove particularly difficult to pass and implement climate policies?

Intended learning outcomes: By completing this course a successful student will be able to

- Describe and analyze environmental problems as a result of economic activity;
- Assess the costs and benefits of different policy instruments for environmental protection;
- Critically discuss societal and economic factors that facilitate or jeopardize the application of environmental policies and regulation;
- Describe the economic cost of climate change and the different methods used to assess such costs;
- Use data and econometric analysis to describe environmental problems, quantify their impacts on societal outcomes and evaluate policies to address such problems.

Pre-requisites: One course in microeconomics and one course in econometrics.

Teachers:

Pamela Campa, Assistant Professor of Economics at Stockholm Institute of Transition Economics (SITE) at the Stockholm School of Economics.

o E-mail: pamela.campa@hhs.se

Guest lecturer: Elena Paltseva. , Associate Professor at Stockholm Institute of Transition Economics (SITE) at the Stockholm School of Economics. Email: Elena.Paltseva@hhs.se

Webpage: Readings, lecture notes, and other information about the course will be uploaded on the course webpage. It is thus very important that you visit it often.

Lectures: There will be 12 three-hour classes. They include standard lecturing, discussions, presentations of group work, a study visit and individual presentations about your experience using a carbon calculator. The lectures are held at the Stockholm School of Economics (see tentative schedule and rooms file).

Readings: The course reading will mostly consist of articles and reports (see below for a preliminary list, subject to revision). There will be no single required textbook. However, occasional chapters from Phaneuf and Torquate (2016) "A course in Environmental Economics: Theory, Policy and Practice", Cambridge University Press, will be used during the course.

Attendance and participation: Regular attendance is strongly encouraged and incentivized; at the beginning of each class the teacher will take note of attendance and your score will contribute to the participation grade.

Active participation in class discussions is expected. You are strongly encouraged to read the lecture slides in advance, and you will also have to read some of the class material in advance to solve some of the short assignments.

Assignment: You will work on a home assignment in groups of three to four. More details on the assignment will be provided throughout the course. Solutions to the assignment will be provided during a lecture.

Individual presentations will be based on some reflections from using a carbon calculator to track your CO2 impact.

Group presentations will be based on a paper that you will choose from a list to be provided at the beginning of the course. Each paper will study an environmental problem or policy. As part of the presentation, you will also have to analyze this problem in the Swedish context. You will receive more instructions during the course.

Written final exam: A 2-hour exam will be held in during the exam week, and will cover all the material of the course. It will include both analytical and essay-type questions. An example of exam questions will be provided early in the course.

Grading: Your final grade will be calculated according to the following breakdown:

- Participation: 5 %
- Individual presentation: 15%
- Group presentation: 20 %
- Home assignment: 20%
- Final exam: 40 %

Course topics and reading list: (please note that the reading list is preliminary and will be updated as the course proceeds. Compulsory reading is marked by *.) Lecture notes will be provided before every class and constitute the core of the course material; you are also expected to read the introduction to the papers listed below as compulsory.

The Economics of Environmental Protection

- *Bhattacharyya (2001). Chapter 23.4.
- Hawken, Paul, ed. Drawdown: The most comprehensive plan ever proposed to reverse global warming. Penguin, 2017.

Background: Fossil Fuel Markets. Oil and Natural Gas. Fracking Revolution.

- *Bhattacharyya, Ch. 14.2.1-2 (scan for historical perspective), 14.3.3.1-3, Ch. 15
- *[Assessment of the Potential Impacts of Hydraulic Fracturing for Oil and Gas on Drinking Water Resources](#), (2015), US Environmental Protection Agency, Chapter 2,
